Zindabad Dash

Every order, from counter to doorstep.

One shared workflow.
Visible evidence at handoff.
Recovery when plans change.

Peak service makes small mistakes expensive

Front of house: prep timing, missing items and wrong handoffs.

Back of house: stock uncertainty, skill gaps and scattered records.

Our focus: catch a mismatch before it becomes a customer problem.

Three perspectives share one live order

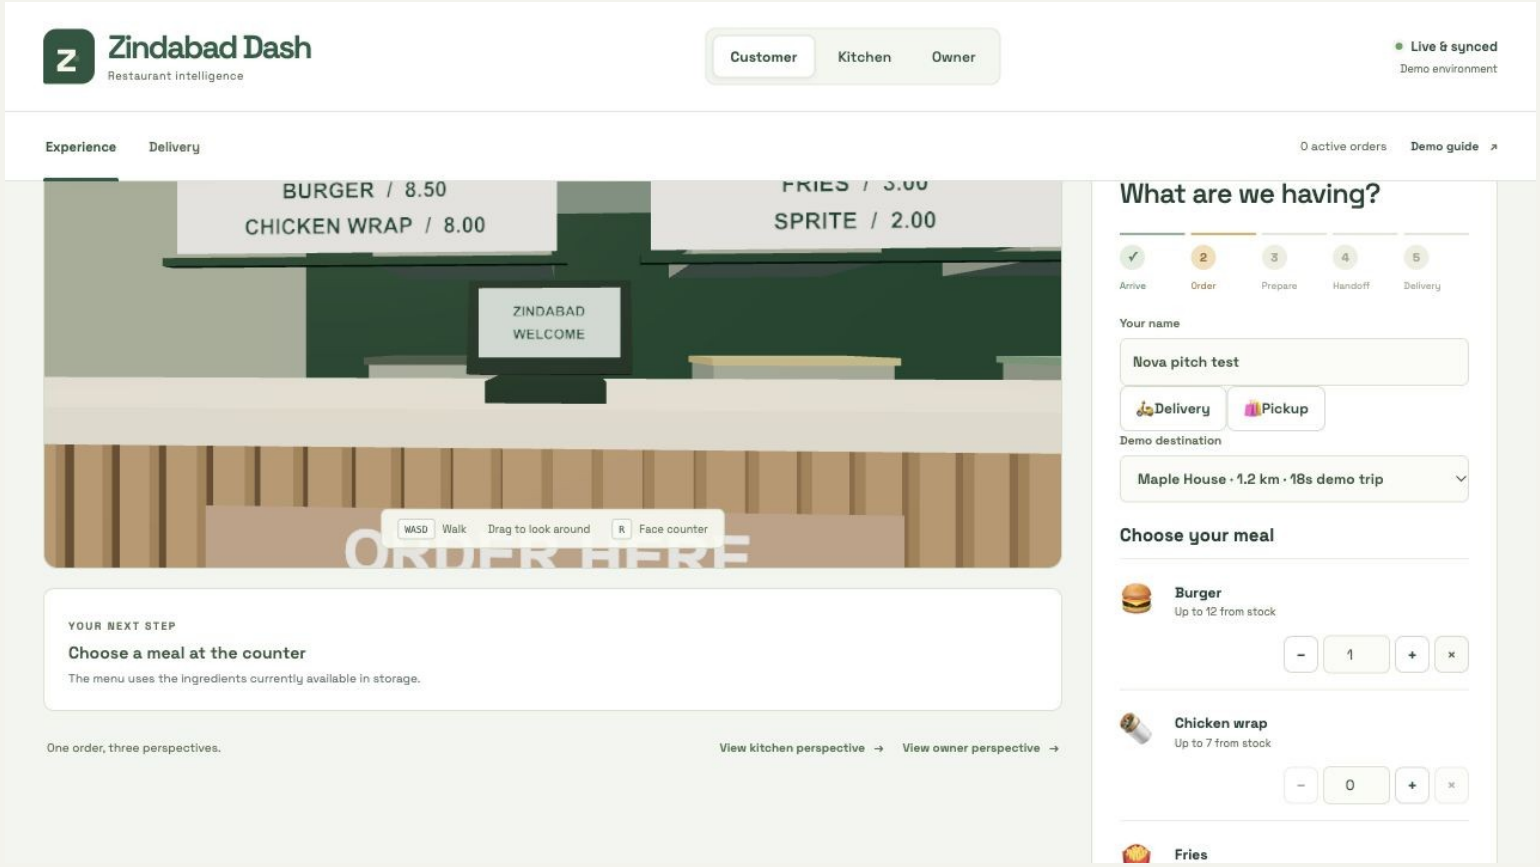

Customer / Walk, order, track and confirm receipt.

Kitchen / Prepare, photograph, verify and release.

Owner / Review stock, staffing, cash and recovery plans.

Changes sync across connected views. Delivery movement is simulated.

A customer journey that makes the workflow tangible

Walk to the counter

Choose from available stock

Follow the same ticket

Live customer ordering perspective.

A missing drink blocks the handoff

1 Missing Sprite: report the mismatch and keep the order unconfirmed.

2 Complete clear bag: compare counts, then ask a person to confirm.

3 At the house: upload another photo before confirming receipt.

Unclear, hidden or unrecognizable items require a new photo.
Synthetic test images demonstrate behavior, not production accuracy.

AI advises at six points in the workflow

Vision checks / Count visible bag contents at packing and delivery.

Prep and inventory / Suggest timing and flag stock to replenish.

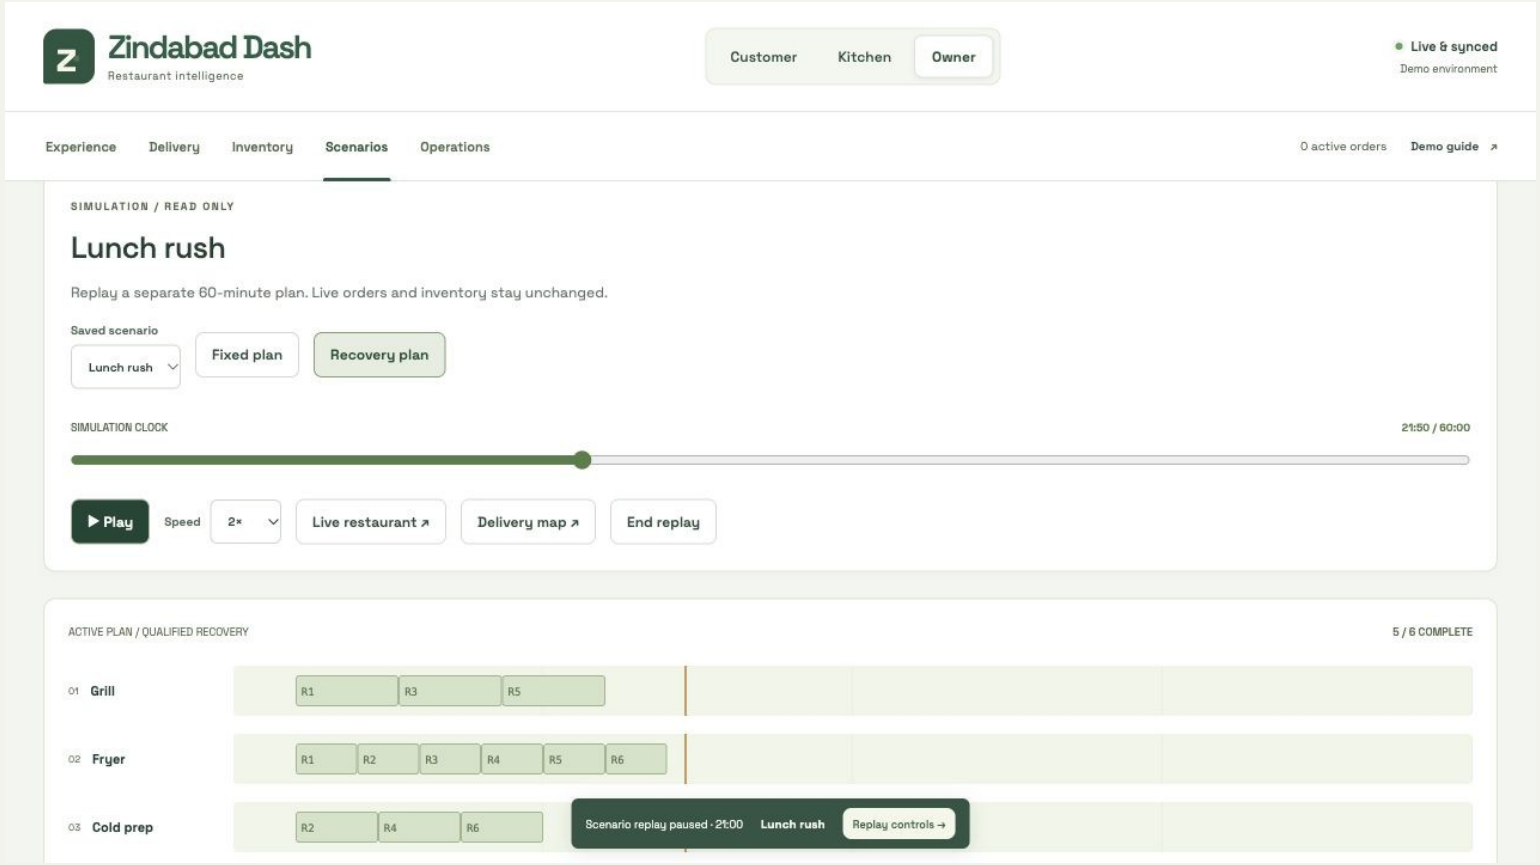

Staff and scenarios / Interpret absences and explain recovery options.

Finance and receipts / Summarize estimates and draft receipt fields.

Five sponsor opportunities, one focused prototype

NOVA opportunity	Prototype response	Next requirement
Prep timing	AI prep advice and shared queue	Real POS channels
Packing and pickup	Photo checks and reference matching	Real bag validation
Inventory	Reservations, alerts and restock workflow	Demand history
Financial health	Receipt review and demo margin estimates	Accounting data
Staffing and skills	Absence scenarios and qualified recovery	Shift and skill history

A disruption becomes a plan the owner can inspect

- Absent worker
- Ingredient shortage
- Equipment outage
- Six-order rush

Shared replay with pause, seek and speed controls. Outcomes are simulated.

Structured evidence keeps AI output reviewable

Input: ticket, photo or current operational evidence.

Model: structured observations and advisory recommendations.

Code: validate schema, compare counts and enforce state rules.

Person: approve a match, restock or recovery action.

Keys stay on the server. Uploaded photos are not retained by the app.

A practical pilot with two Macs and one phone

Mac 1: customer ordering, tracking and receipt photo.

Mac 2: kitchen packing, owner operations and disruption replay.

Phone: optional photos. Clear bags and demo food are enough.

Pilot measures: missing-item rate, handoff accuracy and staff time.

The next step is one real packing station

A connected workflow is ready to test.

Validate real bags, lighting and uncertainty.

Connect order, inventory and shift data.

Measure reliability before expanding automation.

github.com/ibrahimwichka/nova

The clear-bag test is repeatable

MISSING SPRITE / 0 of 1 visible

COMPLETE BAG / 1 of each item

Next replaces the test image and runs a fresh AI analysis. Synthetic test data.
